Introduction

GreenPay™ by Green Payment Processing (<http://www.green.money>) v2.1.0 plugin for WordPress is an extension for WooCommerce which adds an eCheck payment gateway to WooCommerce for use in WordPress.

GreenPay™ by Green Payment Processing adds an eCheck payment gateway that can be used in any WordPress online store to accept eChecks as a method of payment when connected with a Green Payment Processing merchant account. When the GreenPay™ plugin is enabled, an eCheck payment option is available upon checkout which can accept a routing number and account number to create an eCheck that will be processed by Green Payment Processing.

Requirements

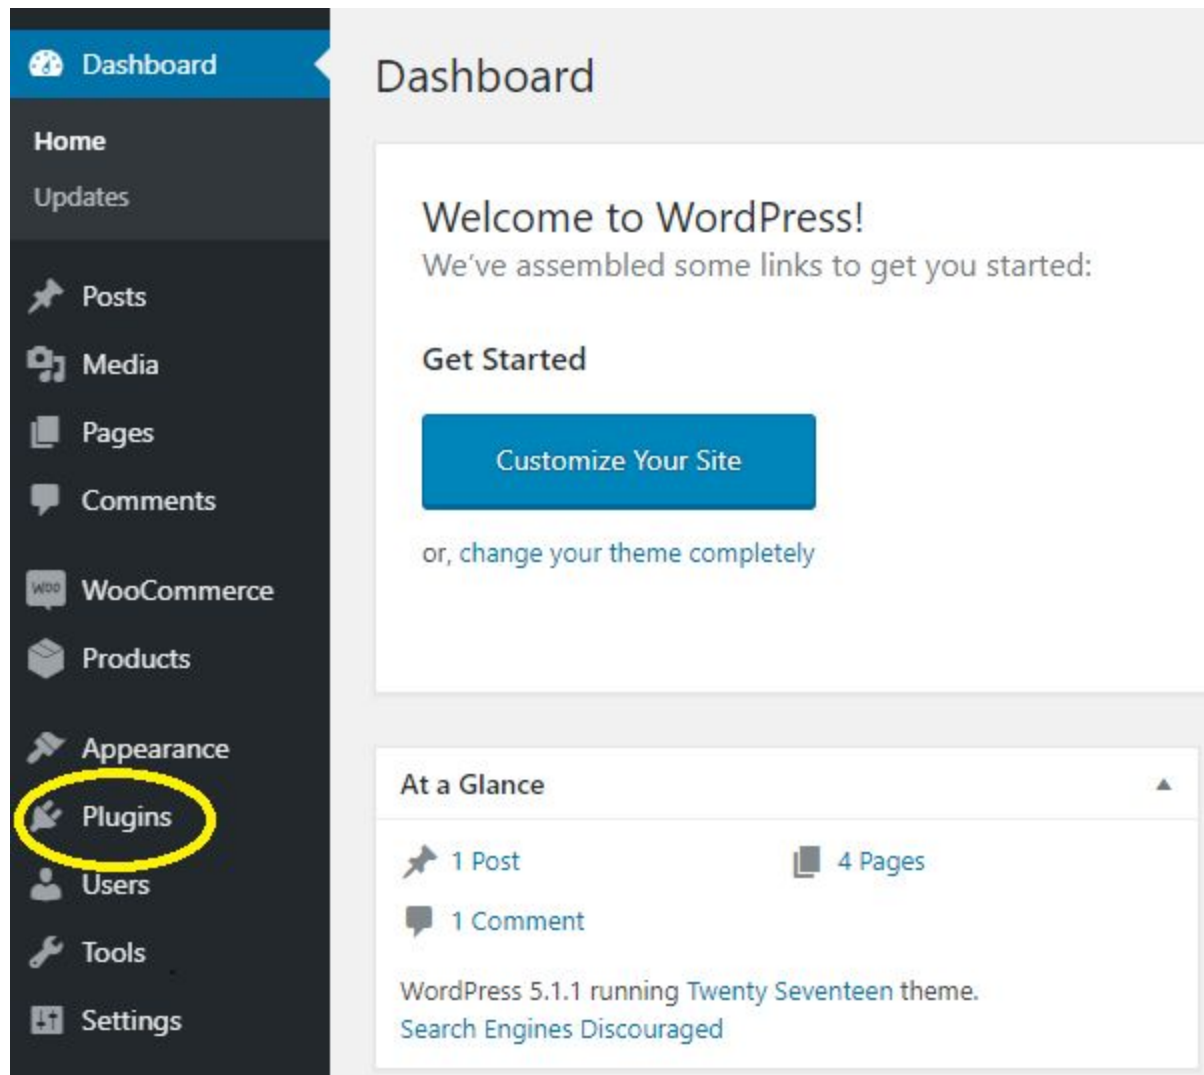

1. You must already be a Green Payment Processing registered and approved merchant. If you are not yet activated or have yet to apply, feel free to read the rest of this manual but you will be unable to follow the steps without being activated! You can contact our Customer Service team via email at support@green.money for any questions!
2. Your site must be SSL secured! Our service resides on a gateway behind 2048 bit SSL encryption and since we're dealing with sensitive banking information, we require all our partners to be SSL secured as well. If you are unsure whether your site is secure, please consult with your IT team or hosting provider.
3. Your store must have the WooCommerce REST API enabled which requires certain settings in Wordpress as far as permalinks. If these settings are not configured correctly, the plugin may not function as expected. Further explanation can be found in the [WooCommerce REST API](#) for the exact settings that will need to be updated, but you can find more information about this from WooCommerce directly at the following link: <https://docs.woocommerce.com/document/woocommerce-rest-api/>

WARNING: If you are currently using the Green-WooCommerce plugin version 1.1 or lower then you should manually deactivate and uninstall that version BEFORE following this guide to install the updated 2.0 version. Earlier versions of our plugin did not have auto-update capability and therefore installing the new plugin with the other installed may cause conflicts and errors.

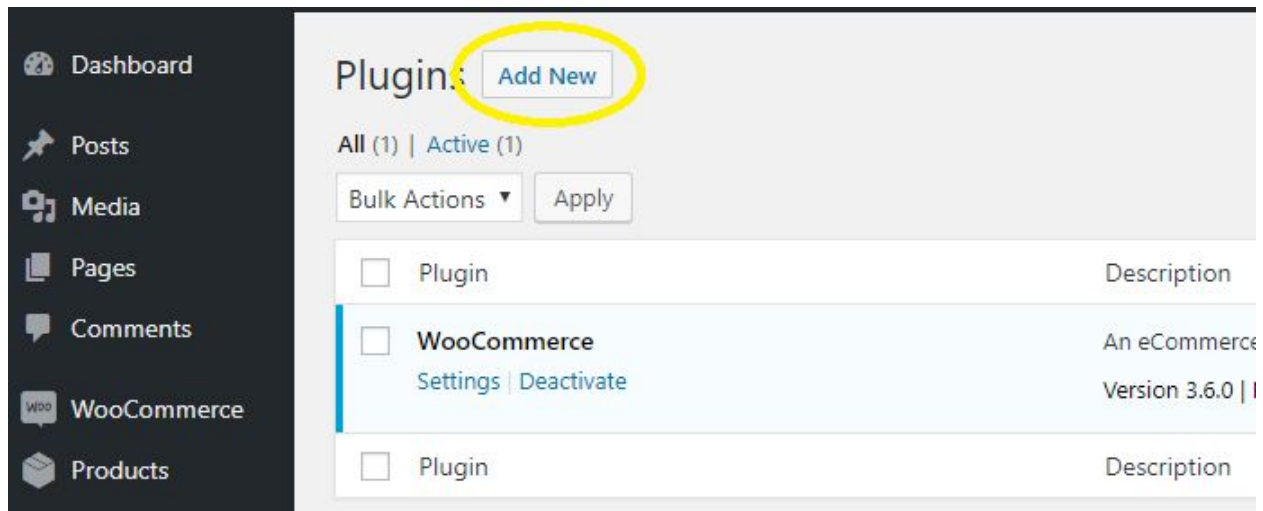

Installation

GreenPay™ requires WordPress version 4.5+ (<https://wordpress.org/>) with at least WooCommerce version 3.0+ (<https://woocommerce.com>).

After a WordPress site has been set up with WooCommerce, navigate to the “Plugins” section via the WordPress dashboard on the left side of the page.

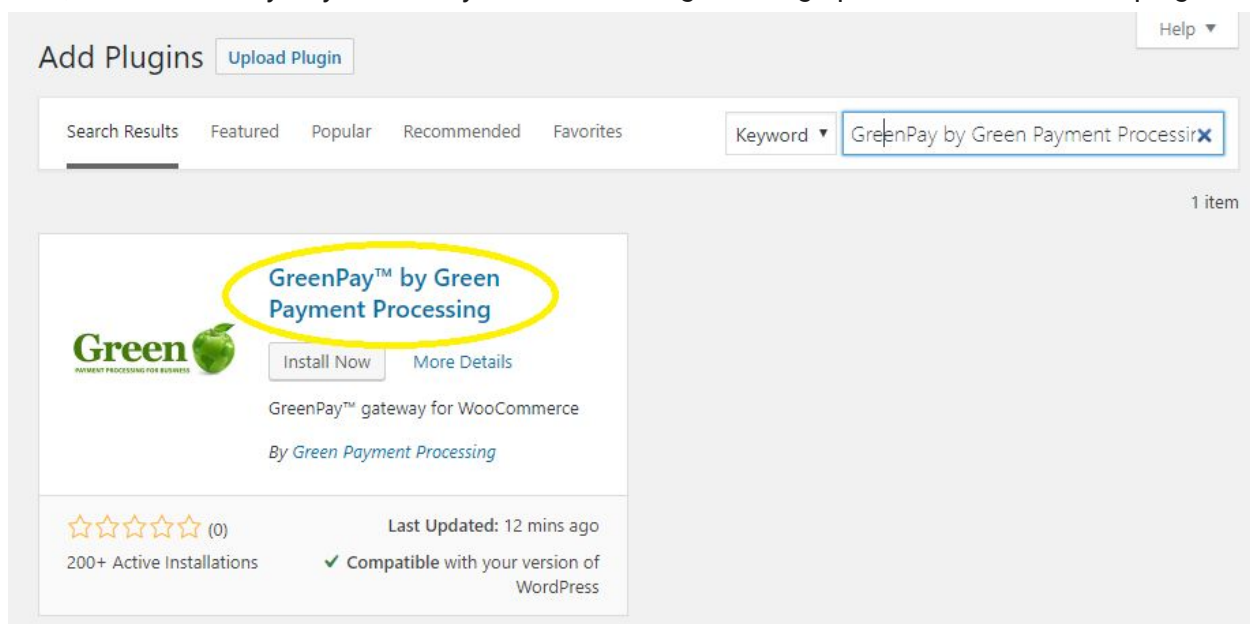

Once on the Plugins page, click on the “Add New” button on the top of the page.

After navigating to the “Add Plugins” page, type “GreenPay by Green Payment Processing” in to the “Search plugins” text box.

Next, click “GreenPay™ by Green Payment Processing” to bring up the details about the plugin.

Click the “Install Now” button located at the bottom of the page. You may wish to read the description and changelog as it can change regularly and may contain relevant information!

GreenPay(tm) by Green Payment Processing

Description [Installation](#)

This is a plugin that extends WooCommerce with a GreenPay(tm) payment gateway option that can be used to process payment. When enabled a GreenPay(tm) payment option is displayed on checkout giving users the ability to pay via a GreenPay(tm) eCheck that will be processed by the GreenPay(tm) system.

API Credentials

Email support@green.money with a subject of “API Credentials” and give a brief explanation of your needs and a representative will get back to you with API URL and password.

1.2.11

*Rebranded the plugin to GreenPay(tm) by Green Payment Processing

1.2.10

*Fixed issue that wasnt allowing some users to activate the plugin

1.2.9

*Fixed an issue with testing Client_ID and API Password was always returning false for some users.

Version: 1.2.11

Author: [Green Payment Processing](#)

Last Updated: 1 min ago

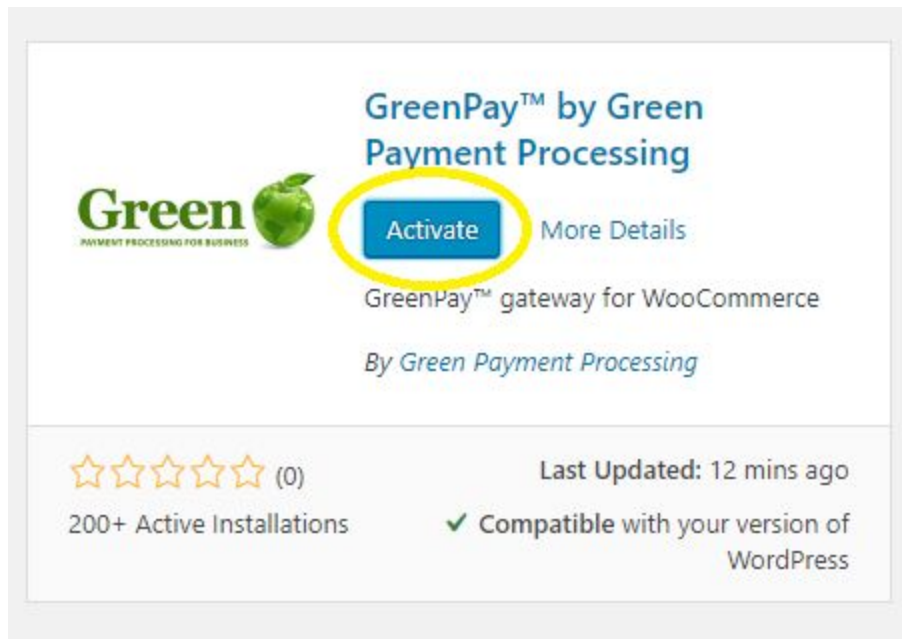

Compatible up to: 5.1.1

Active Installations: 200+

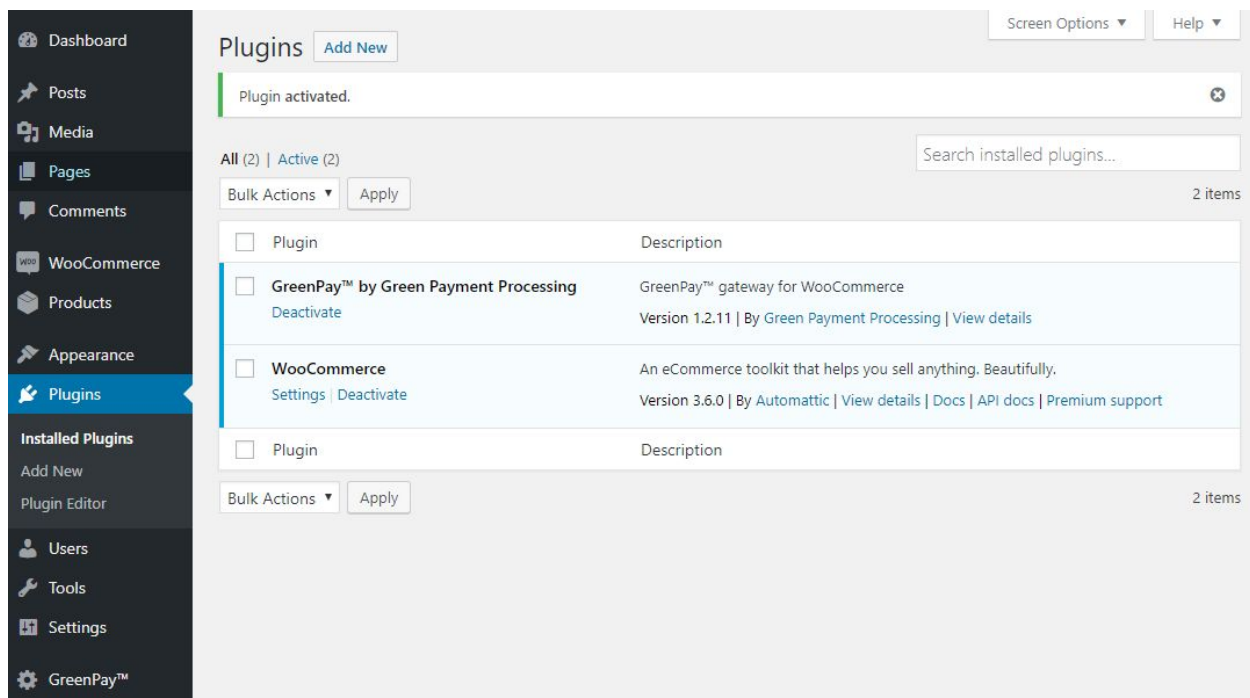

[WordPress.org Plugin Page »](#)

Install Now

Once GreenPay™ has been installed, click the “Activate” button.

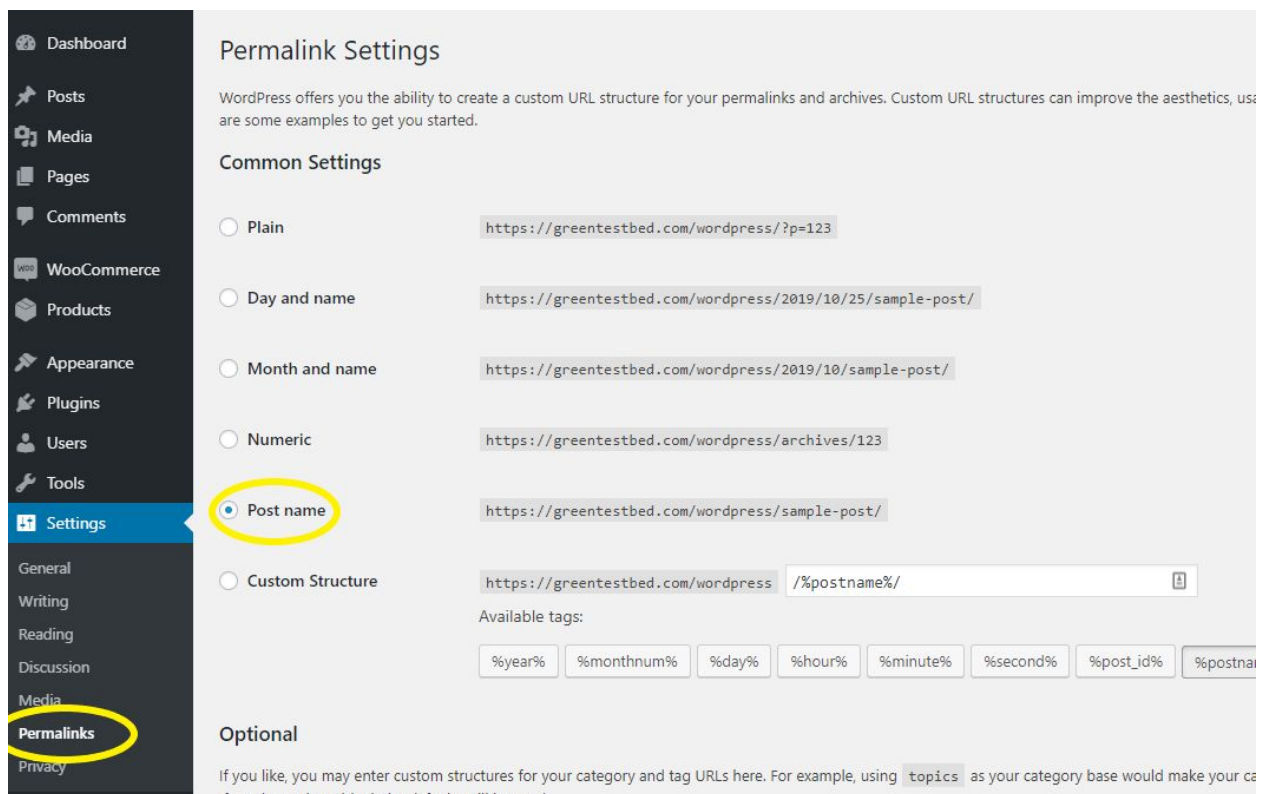

When the plugin has been activated, you will be redirected back to the “Plugins” page which should look similar to this.

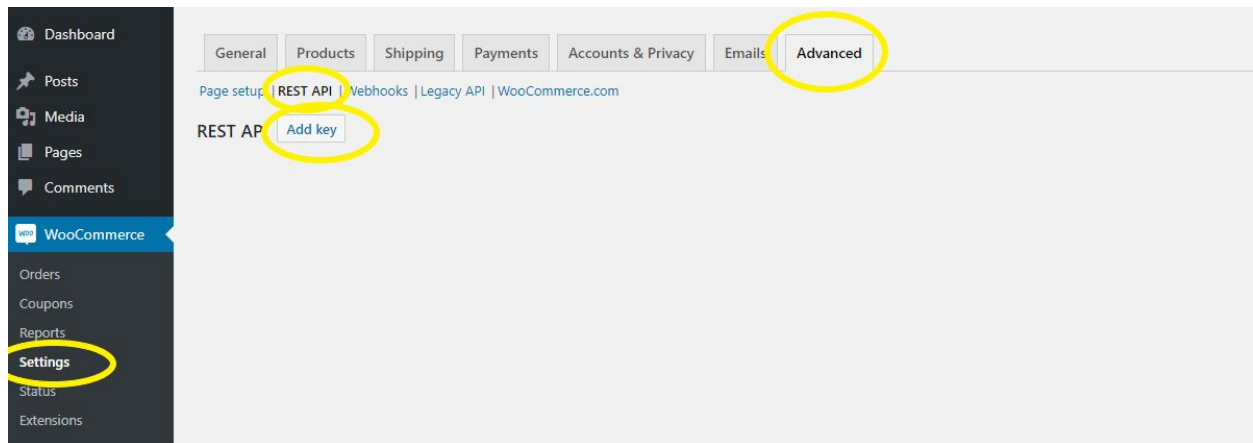

WooCommerce REST API

The WooCommerce REST API is a service that allows Green to update the status of orders in your store after the order has been created so you know that your store will have the most up to date information possible! In order for our processing service to update your store, you will need to make sure your store's REST API is available following the below steps.

To begin with, WooCommerce's REST API requires that your Wordpress store have "pretty permalinks" enabled. In order to enable these, navigate to the Settings dropdown and go to the Permalinks section. Here, make sure that the Common Settings are set to "Post name" and once that's changed make sure to scroll down and hit the Save button to ensure this is changed!

Now navigate to the WooCommerce settings page in the navigation menu. On the settings page, open the “Advanced” tab and then go to the “Rest API” settings and then click “Add Key”.

WARNING: This page contains separate “Legacy API” settings that we DO NOT need. ONLY update the Rest API as explained here.

Set the Description to “GreenPay Plugin Access.” We recommend setting the User to your main administrative user and then make sure that the Permissions are set to Read/Write so that our plugin can add order notes and change order status.

A screenshot of the 'Key details' form in the WooCommerce REST API settings. The form has three fields: 'Description' (a text input), 'User' (a dropdown menu showing 'admin'), and 'Permissions' (a dropdown menu showing 'Read/Write'). Each field has a question mark icon to its left. At the bottom of the form is a blue button labeled 'Generate API key'.

When you click “Generate API Key”, you’ll be taken to a new page that contains a Consumer Key and Consumer Secret. As the warning indicates, you must copy these values to a notepad or other safe place for a moment as we’ll need them in the next step of the installation, but once you navigate away from this page, those values will be hidden and you’ll have to revoke this key and generate another one!

Key details

API Key generated successfully. Make sure to copy your new keys now as the secret key will be hidden once you leave this page.

Consumer key	<input type="text" value="sk_23ba1838871a4a45a97940a9a9117171baa2980112885"/>	<button>Copy</button>
Consumer secret	<input type="text" value="sk_23ba1838871a4a45a97940a9a9117171baa2980112885"/>	<button>Copy</button>
QRCode		

Setup and Configuration of GreenPay

Click on the “GreenPay™” settings button on the bottom left.

The screenshot shows the WordPress dashboard's Plugins page. On the left sidebar, the 'Plugins' menu item is highlighted in blue, and the 'GreenPay™' settings button (represented by a gear icon) is circled in yellow at the bottom of the sidebar. The main content area shows the 'Plugins' section with a notification 'Plugin activated.' at the top. Below this, there are filters for 'All (2)' and 'Active (2)', and a search bar for installed plugins. A table lists the installed plugins:

<input type="checkbox"/>	Plugin	Description
<input type="checkbox"/>	GreenPay™ by Green Payment Processing Deactivate	GreenPay™ gateway for WooCommerce Version 1.2.11 By Green Payment Processing View details
<input type="checkbox"/>	WooCommerce Settings Deactivate	An eCommerce toolkit that helps you sell anything. Beautifully. Version 3.6.0 By Automattic View details Docs API docs Premium support
<input type="checkbox"/>	Plugin	Description

At the bottom of the table, there are bulk action buttons: 'Bulk Actions' and 'Apply', and a note '2 items'.

Configure settings:

- API Mode** can either be in Live mode or Test mode:
Live mode: the Live API endpoint is the Green Payment Processing system. When this mode is enabled, your checks will be processed regularly!
Test mode: the Test API endpoint is so you can test your system by running checks through a Sandboxed server.
- Client ID and API Password:** Your Green API Credentials! To obtain your API Credentials, please contact us via email at support@green.money with the subject line "API Credentials"¹
- WooCommerce REST Client ID and Secret:** These are the WooCommerce REST credentials that you copied from earlier. Insert the Consumer Key into the REST Client ID field and enter the Consumer Secret into the Rest Client Secret field
- Payment Method Title:** We recommend something simple like GreenPay eCheck
- Description:** a short message that displays for the customer at checkout to explain the payment method.
- Extra Message:** Any additional details that will display below the description.
- Verde™ Tokenization Widget:** The Verde™ Tokenization and Bank Login widget is only available for certain merchants. If you would like access to this service, please contact customer service at support@green.money with the subject line "Verde™ Tokenization Service". Once the service has been enabled, this section will become available and you can turn the widget on and off at checkout using the **Allow Widget For Customers** setting.
- Debug Log**²: enables debug log messages to be inserted into /wp-content/uploads/wc-logs/ and will be in a file with this formatted name greenmoney-[YEAR YYYY]-[MONTH MM]-[DAY DD]-[TEXT].log which will look similar to greenmoney-2018-07-13-47a43037c62a79c5efa71ef148d53725.log
- API URL**²: specify the URL that is used for REST API communications
- Verification mode:** can either be in Legacy mode or Permissive mode. These are further explained in the [Legacy vs Permissive Verification mode](#) section of the document but if you are unsure of what to put here, just use Legacy!

Widget Enabled: ☒

Allow Widget For Customers: ☒

Advanced Settings:

The settings in this section are intended for advanced users only and may affect the behavior of the plugin. If you are unsure what you are doing or haven't been given direction by a Green representative to change them, please ignore these settings.

Debug Log: ☒

API URL:

Verification mode:

Legacy Mode - (Default) All checks that return a risky code are automatically cancelled and a note added to the order with an explanation in WooCommerce. This is how the GreenPay™ plugin has functioned in the past so if you're unsure of which to choose, you should likely not change this setting and continue using Legacy mode!

Permissive Mode - All checks that return a risky code that can be overridden are not cancelled but allowed into your Green Payment Processing eCheck/Risky/Bad checks. The WooCommerce order will be set to "On Hold" status and will require you as a merchant to manually override the check and update the order status in WooCommerce to fit your needs and risk acceptance.

If you have a Risky/Bad order marked "On Hold", you can click on the individual order from the WooCommerce Orders page and select the "GreenPay™ Override Risky/Bad" order action from the "Order actions" dropdown, or you can manually override and update the order status in WooCommerce.

Log in to your Green Payment Processing Portal and navigate to the Risky/Bad checks page under the "Checks" dropdown. Find the check for your order here by searching for the person's name or some other information. On the right hand side for that check, you'll find a link to Override the Risky code which will continue its processing in Green Payment Processing. After that's complete, you can manually change the status in WooCommerce to "Completed" whenever you'd like.

If you have trouble with this process, please contact Customer Support by emailing us at support@greenmoney or calling our helpline at 404-881-1400.

Save Changes

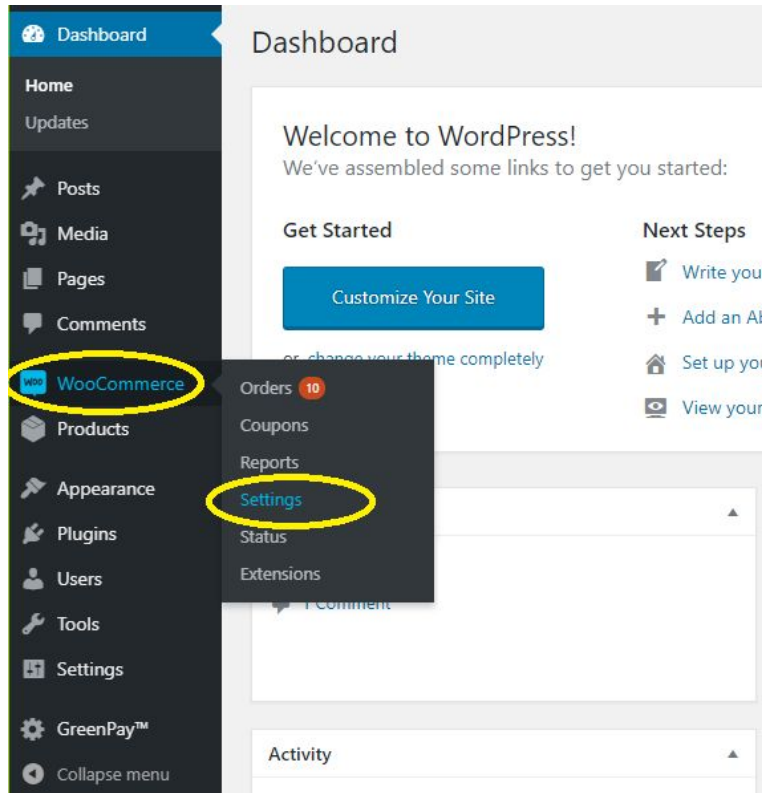

¹ Please note that the API credentials for Live Mode and Test Mode **ARE NOT** interchangeable. They are separate credentials and if you require one or the other, please note that in your email to support@green.money

² This should only be used if you're an experienced user, a developer tracking down information, or have been explicitly directed to do so by a Green IT representative.

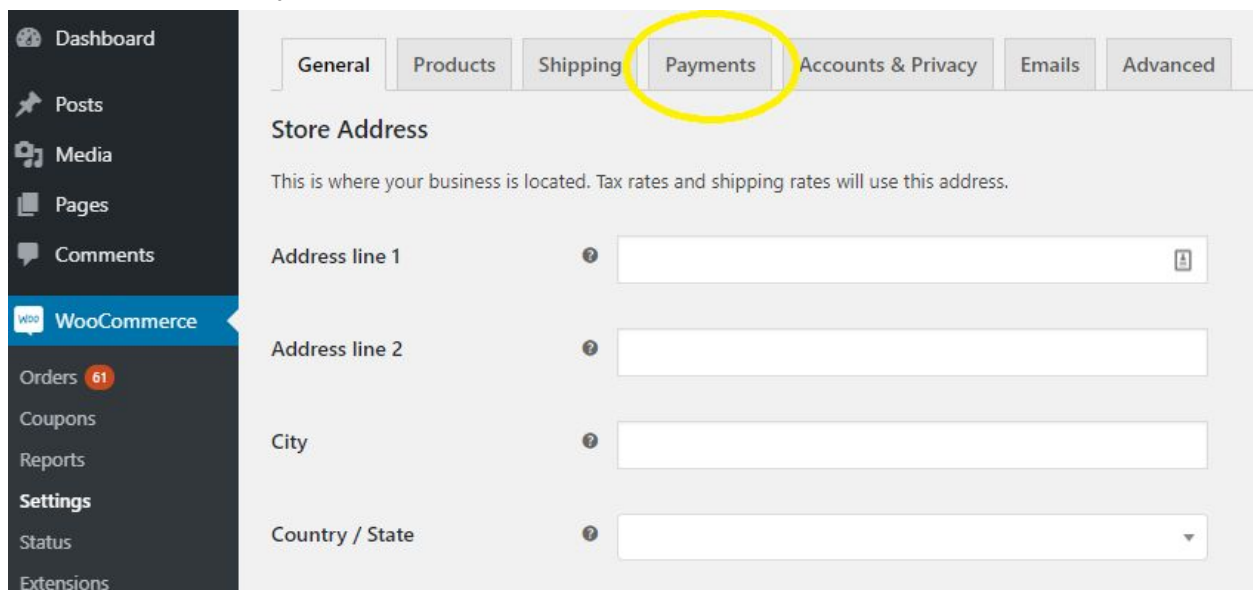

Once all the above has been configured with your values, make sure to hit the Save Changes button at the bottom of the page! If everything validates correctly, your values will save! If anything is incorrect, you may see errors, each of which should state the issue! For example, if your Green API credentials don't validate with your selected Mode, a warning will display in the Wordpress admin section asking you to double check them.

WooCommerce Checkout Settings

Next, we'll navigate to the WooCommerce Settings once more to make sure the checkout settings are set correctly to require all the fields we need for an eCheck.

Then click on the "Payments" button on the top of the page.

After navigating to the Payments section, make sure GreenPay™ is enabled here by WooCommerce. Enabling the other options is entirely up to you, as they have nothing to do with this plugin or Green Payment Processing. After enabling the payment gateway(s) that are needed, click the “Save changes” button on the bottom.

The screenshot shows the WooCommerce Payments settings page. The left sidebar contains the WordPress dashboard menu with 'WooCommerce' expanded. The main content area has tabs for 'General', 'Products', 'Shipping', 'Payments', 'Accounts & Privacy', 'Emails', and 'Advanced'. The 'Payments' tab is active, showing 'Payment methods'. Below this, a table lists installed payment methods with columns for 'Method', 'Enabled', and 'Description'. The methods listed are 'Direct bank transfer', 'Check payments', 'Cash on delivery', 'PayPal', and 'GreenPay™'. The 'GreenPay™' row has its toggle switch turned on and is highlighted with a yellow circle. The 'Save changes' button at the bottom left is also highlighted with a yellow circle.

Method	Enabled	Description
Direct bank transfer	<input type="checkbox"/>	Take payments in person via BACS. More commonly known as direct bank/wire transfer Set up
Check payments	<input type="checkbox"/>	Take payments in person via checks. This offline gateway can also be useful to test purchases. Set up
Cash on delivery	<input type="checkbox"/>	Have your customers pay with cash (or by other means) upon delivery. Set up
PayPal	<input type="checkbox"/>	PayPal Standard redirects customers to PayPal to enter their payment information. Set up
GreenPay™	<input checked="" type="checkbox"/>	GreenPay™ Settings Manage

[Save changes](#)

How to use

After following the installation and setup instructions found above, GreenPay™ is ready for use! When a customer navigates to your WordPress store and is ready to checkout, a GreenPay™ payment option is displayed.

☒ GreenPay™ eCheck

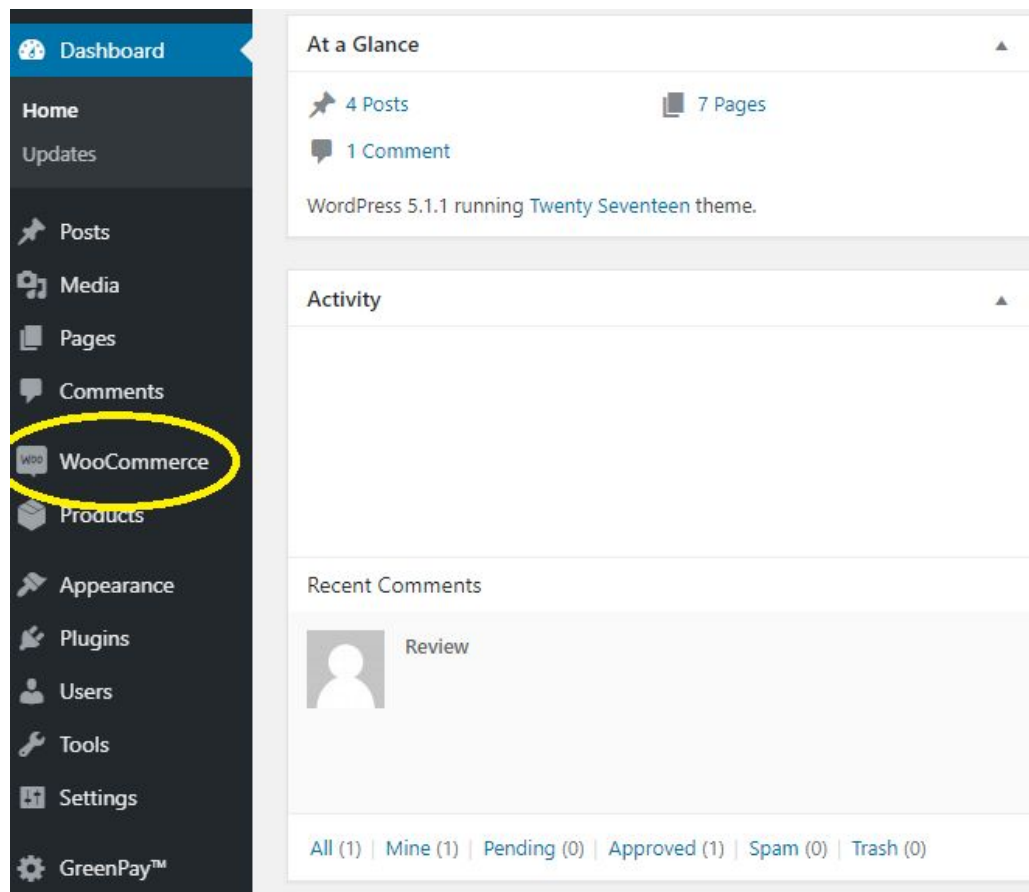

This is the description

Routing Number *	Account Number *
.....	

The customer will see the above payment option displayed to them on checkout, giving them the option to enter a routing number and an account number to complete the payment using an eCheck which will be processed by the Green Payment Processing system. The routing number must be a valid 9 digit routing number with an account number between 5 and 17 digits. Anything incorrect entered into these fields, like letters and special symbols, will show an error on the top of the page explaining why the entered routing and account numbers are wrong.

- Routing Number is invalid (only digits are allowed)
- Account Number is invalid (only digits are allowed)

If the routing number and account number have been entered correctly, and the customer placed the order, the order will be inserted into your WooCommerce Orders section accessible by clicking the “WooCommerce” button on the left side of the WordPress dashboard.

The screenshot shows the WooCommerce 'Orders' page. The left sidebar contains navigation links: Dashboard, Posts, Media, Pages, Comments, WooCommerce (active), Orders (6), Coupons, Reports, Settings, Status, Extensions, Products, Appearance, Plugins, Users, Tools, Settings, GreenPay™, and Collapse menu. The main content area is titled 'Orders' and includes a 'GreenPay™ Status Update All' button. Below this, a summary shows: All (111) | Processing (61) | On hold (5) | Completed (14) | Cancelled (1) | Refunded (6) | Failed (23). There are filters for Bulk Actions, All dates, and Filter by registered customer. A table lists 110 items, showing 6 orders. The table has columns: Order, Date, Status, Total, and Actions.

Order	Date	Status	Total	Actions
#666	Apr 9, 2019	Processing	\$241.99	✓
#665	Apr 9, 2019	Processing	\$483.98	✓
#663	Apr 8, 2019	Processing	\$241.99	✓
#662	Apr 8, 2019	Processing	\$241.99	✓
#661	Apr 8, 2019	Processing	\$1,002.00	✓
#660	Apr 8, 2019	Processing	\$241.99	✓
#648	Mar 28, 2019	Processing	\$241.99	✓
#646	Feb 20, 2019	Processing	\$241.99	✓
#645	Feb 20, 2019	On hold	\$241.99	⋮ ✓

The WooCommerce Orders page

On your WooCommerce Orders page, you'll see listed all the orders placed within your online store. When an order is placed using GreenPay™ and the eCheck is not flagged as Risky/Bad, the status of the order is set to "On-Hold." If your GreenPay™ setting for Verification Mode is set to "Legacy" and the eCheck did verify as Risky/Bad, the eCheck is automatically cancelled in Green Payment Processing and the order status is set to "Failed." This behavior can be altered by setting the Verification mode from "Legacy" to "Permissive" which will be explained in greater detail later.

Completing orders

The GreenPay™ plugin process completes when the order is marked as "Processing" in WooCommerce. Using the WooCommerce REST API credentials you supplied earlier, Green attempts to reach out to your store at the time the check is processed in our system to update the status of the order to "Processing." The reason our plugin doesn't mark the order as complete for you is because every Green Payment Processing merchant has a different definition of complete as far as payment receipt or product shipping.

Our plugin leaves that portion up to you as a merchant to decide when you'd like to handle those steps. Additionally, because these further updates are reliant on the WooCommerce REST API, it is possible that your site is unavailable when we reach out and errors can occur when attempting to update the order status. Our service will attempt a number of times to run the

update but if it continually fails, we will no longer attempt updates. We recommend that all merchants verify manually the processing status of a check if no updates are received within 24 hours.

To mark an order as complete, you can either click the “Complete” order action button on the end of all processing or on-hold orders from the WooCommerce Orders page, or you can click on the individual order, select “Completed” from the Status drop down menu and then click the “Update” button on the top right of the page.

The screenshot displays the WooCommerce Orders interface. At the top, a table lists orders with columns for checkboxes, Order ID, Date, Status, Total, and Actions. Three orders are shown, all with a status of 'Processing'. The 'Complete' button in the Actions column for Order #686 is highlighted with a yellow circle.

Below the table, the 'Edit order' section for Order #686 is visible. It includes details about the payment (GreenPay™ eCheck) and the date (April 17, 2019). The 'Status' dropdown menu is open, showing options: Processing, Pending payment, Processing (highlighted), On hold, **Completed** (highlighted with a yellow circle), Cancelled, and Refunded.

On the right side, the 'Order actions' section shows a dropdown menu with 'Choose an action...' and a right arrow. Below it, there is a 'Move to trash' link and an 'Update' button, which is also highlighted with a yellow circle. The 'Order notes' section shows two notes: 'Check Accepted and would be processed by Green Payment Processing. Order status changed from Pending payment to Processing.' and 'GreenPay™ check accepted (Check_ID: , CheckNumber:)'.

Status Updates

The GreenPay™ plugin acts as a gateway to allow your customers to checkout with our eCheck service through your store and due to the nature of eCheck processing, there will likely be some time that passes between when the order is created and the eventual processing of the check to your bank then to you receiving the funds. Due to this, the GreenPay™ plugin has several different ways to make sure your store has the most up to date information with the check status in Green!

Automated Updates

Our GreenPay plugin by default attempts to update the status of your store by using the WooCommerce REST API previously setup in this installation document. When certain actions happen in the Green system, our service reaches out to your store to update the status of the order or add notes to explain what's happening³! The standard workflow is as follows:

1. When an *order is created* in your WooCommerce store, the order is initially created under the **Pending** status by default.
2. When a *check is created* in Green (which may be at the time of order creation or may be shortly thereafter if using the Verde™ tokenization service), the order status is updated to **On-Hold** and a note made with the Check ID and Number in the Green system.
3. When *phone verification is completed* (if applicable to the check and your merchant settings) a note is made with the outcome of that process. If phone verification returned a failing code, the order status will be updated to **Failed**.
4. When the *check is processed* by Green, the order status will be updated to **Processing** and a note made stating the check was processed.

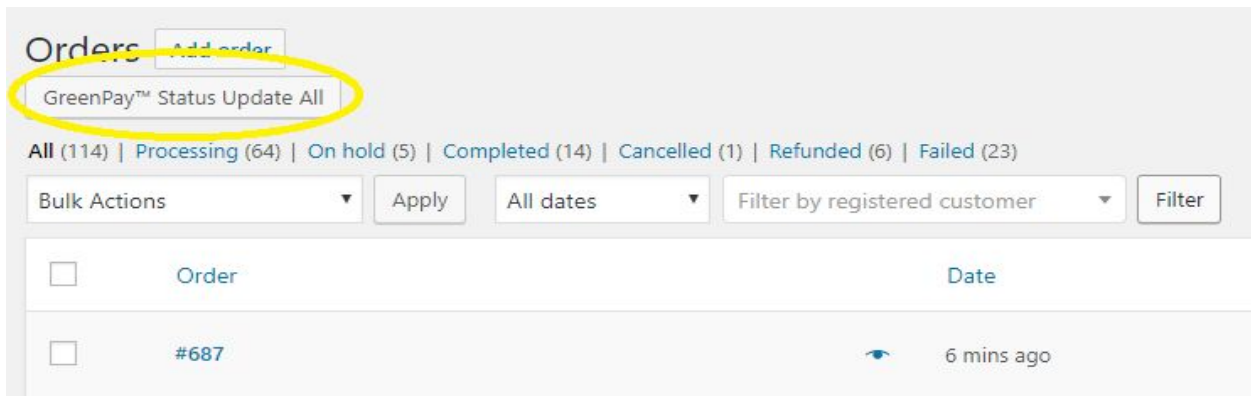

Once the order status is set to Processing, the GreenPay plugin will no longer update your order as Green leaves the decision up to you as a merchant to decide when to mark the order as completed or otherwise. GreenPay™ will only change the order status off of **Completed** if the transaction has **Failed** for some reason, otherwise the order status will remain the same for your convenience as some merchants prefer to complete orders before the transaction has processed through Green Payment Processing.

Manual Status Update

If for any reason the automated updates are not working in your store and you've attempted to troubleshoot your configuration, you have several methods available to you to request manual

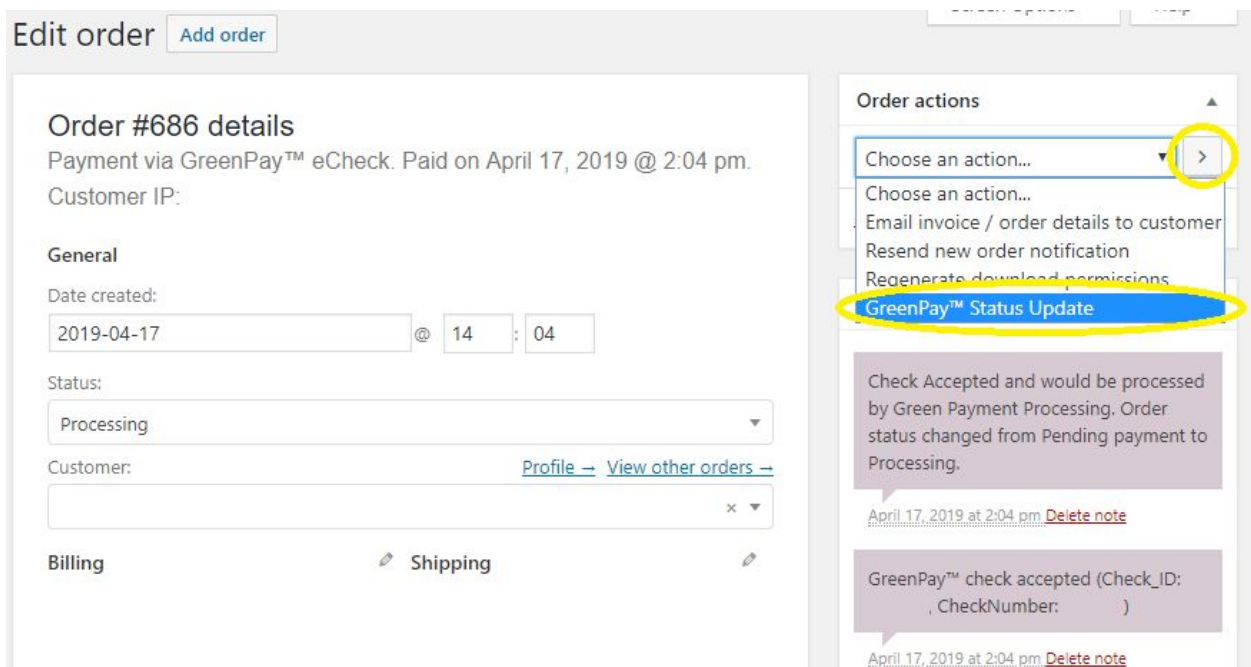

³ Green does not guarantee that all updates will come through. Green will automatically attempt to reach out to your store to update status and add notes, but it is possible this communication could fail due to any number of reasons outside of Green's control. Green will attempt to retry the call a number of times before stopping. We recommend merchants check with their Green Portal the status of any given check to be sure to get the most up to date information.

updates of an order's status. On the WooCommerce Orders page, there is a "GreenPay™ Status Update All" button on the top left under the "Add order" button.

The "GreenPay™ Status Update All" button will perform a status check on all orders using GreenPay™, skipping all that are marked completed or failed. The status returned will either be **On-Hold**, **Processing**, or **Failed** based on the result from Green Payment Processing API.

If you want to run a status update for an individual order, you can do so by clicking on the order on the WooCommerce Orders page and then selecting "GreenPay™ Status Update" from the Order actions dropdown menu on the right side of the page and then click the execute arrow.

Legacy vs Permissive Verification mode

Legacy:

Legacy is the default verification mode which can be set from the GreenPay™ settings page. All checks that return a Risky/Bad code are automatically cancelled and a note added to the order in WooCommerce with an explanation. This is how the GreenPay™ plugin has functioned in the past so if you're unsure of which to choose, you should likely not change this setting and continue using Legacy mode!

Permissive:

All checks that return a risky code that can be overridden are not cancelled but allowed into your Green Payment Processing Risky/Bad checks. The WooCommerce order will be set to "On-Hold" status and will require you as a merchant to manually override the check and update the order status in WooCommerce to fit your needs and risk acceptance.

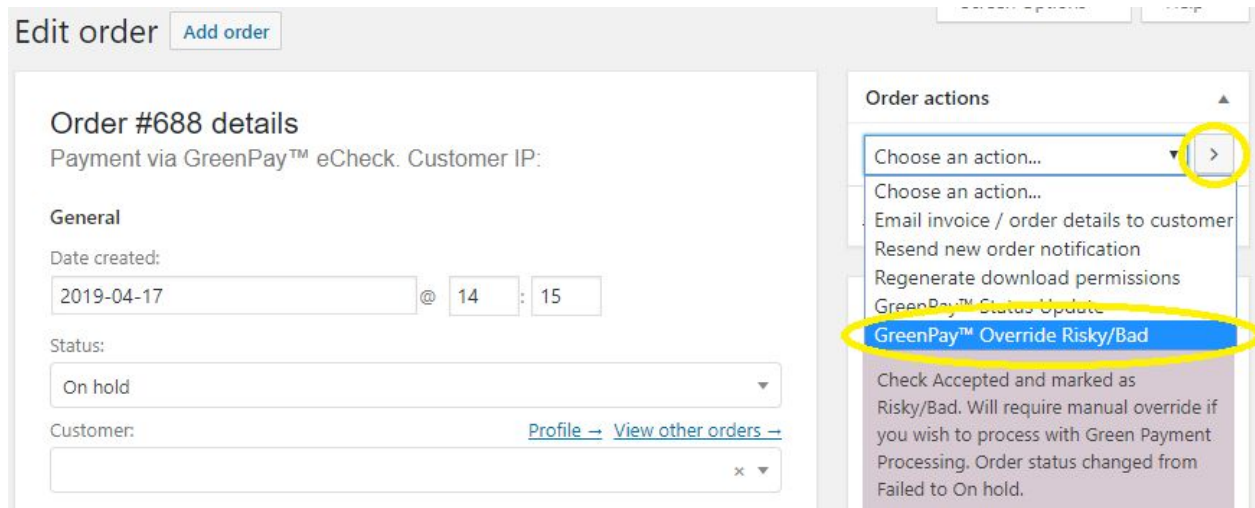

If you have trouble with the verification mode, please contact Customer Support by emailing us at support@green.money or calling our helpline at 404-891-1450.

Overriding Risky/Bad

When your WordPress site is in "Permissive" verification mode as described above, when a Risky/Bad code is encountered, the order will be marked as "On-Hold" and will not be processed by Green Payment Processing unless you manually override the Risky/Bad code to process the order.

Override using plugin:

If you have a Risky/Bad order marked "On-Hold", you can click on the individual order from the WooCommerce Orders page and select the "GreenPay™ Override Risky/Bad" order action from the Order actions dropdown, and then click the execute arrow on the right. If not in "Permissive" mode, this order action will not be available.

This will push the Risky/Bad check through to the Green Payment Processing system to be processed and an order note will be added to WooCommerce stating that the Risky/Bad check was overridden and will be processed.

Override without using plugin:

If you want to override a Risky/Bad check outside of your WordPress site, log in to your Green Payment Processing Portal and navigate to the Risky/Bad checks page under the "Checks" dropdown. Find the check for your order here by searching for the person's name or some other information. On the right hand side for that check, you'll find a link to Override the Risky code which will continue its processing in Green Payment Processing. After that's complete, you can manually change the status in WooCommerce to "Complete" whenever you'd like.

If you have trouble with the overriding Risky/Bad, please contact Customer Support by emailing us at support@green.money or calling our helpline at 404-891-1450.

Refunding orders

GreenPay™ allows the WordPress site administrator to refund orders using the Green Payment Processing system.

When you have an order that you would like to refund, simply click on the order you want refunded from the WooCommerce Orders page and click the “Refund” button on the bottom of the page.

Verde™ Tokenization Service and Bank Login Widget

The Verde™ service is now available for our GreenPay plugin on WooCommerce! This allows the customer to pay via eCheck without needing to know their bank routing and account number as our login widget walks them through the process of logging into their bank account directly!

This service is provided as an additional functionality and may be subject to additional terms of service and costs to your Green Account. For more information about this service and inquiries about how to get it turned on for your account, please contact Customer Support at support@green.money via email with the subject line “Verde™ Tokenization Widget” and a representative will be happy to help.

Once you have the tokenization service turned on for your Green account, you’ll find that the settings page for GreenPay will allow you to set the checkbox for Allow Widget for Customers setting. See the [Setup and Configuration of GreenPay](#) section for further details. When this setting is enabled, your Checkout page will now look like this:

☒ GreenPay™ eCheck

Pay via GreenPay eCheck! We will directly debit your bank account for your order.

Bank Login

Manually Enter Account

Launch Bank Login

Here, your customers can choose to go through the Bank Login widget or still manually enter their account information as previously detailed. When “Launch Bank Login” is pressed, the widget fires up and walks the customer through the process of signing into their bank account through a highly secured process that goes through a tokenization service

After they follow the prompts, their account is registered in the secure tokenization service and they can use that account to check out! Multiple accounts can be registered and the accounts are saved to their device so when they checkout in the future, they can continue using that tokenized account without needing to log back into their bank again!

● GreenPay™ eCheck

Pay via GreenPay eCheck! We will directly debit your bank account for your order.

FAQ

This section will be dedicated to commonly asked questions as well as some helpful tips and tricks on using our plugin to get you started! If you're having issues after installing our plugin, check here for the answers first and if your question isn't answered here, feel free to reach out to us at support@green.money for more!

I'm unable to save my configuration during setup!

Whenever you attempt to save your WooCommerce REST credentials, the credentials are securely sent to our server and our server attempts to validate them by making a quick call to your store using those credentials. If that call fails for any reason, then our server sends an error back and your store's configuration is reverted. This is usually one of two different errors which we'll explain below!

WooCommerce REST API credentials are invalid. Please double check your entry or generate new REST credentials.

Our server has attempted to reach out to your store and was unable to reach it at all which indicates to us that your REST API credentials returned a 401 Unauthorized response. In most cases this is due to incorrectly copied/pasted credentials so we would advise going back to the [WooCommerce REST API](#) step and generate new credentials.

In some cases, this is caused by a missed configuration setting that is causing the REST API to be unavailable completely. The most common culprit is incorrect [Permalink Settings](#) so make sure you have set this to "Post Name" as this is a requirement set by WooCommerce. When you make this change, make sure to hit "Save Changes" as well!

WooCommerce REST API credentials validated but your store is not respecting Basic Authentication. A secure connection could not be made and your configuration was not saved.

In this case, our server was able to connect to your store with the credentials you supplied, but we were only able to connect using an insecure communication method. In other words, your credentials are valid but for some reason, your store is not respecting the security protocol required by WooCommerce known as Basic Authentication. Since we are a payment provider we require that all data connections be made securely and since this is the case, your server configuration will need to be updated to correct this issue before you can use GreenPay™.

For more information on how to potentially fix your server configuration, please see our [Knowledgebase solution article](#) on this issue.

I'm getting an error at checkout! What should I do?

That is going to depend on the error. We'll start off with the most common errors we see which are:

Invalid Email Address and Invalid Phone Number

This can be caused by two different issues, but one is more likely than the other! In very rare cases, this is caused by formatting issues. Our system does the best it can to try to read various formats including international format (using the +CountryCode identifier) as well as any number of different character separators, and no separators, but if any weird or odd characters are passed then it could be a formatting issue. All phone numbers should be at least 10 digits and we recommend they be separated by hyphens, though WooCommerce may dictate how they are sent so this should not be your problem.

Similar to email addresses, it's possible that there's a formatting issue, but it's not likely. A valid email should be in the format "[name]@[domain].[tld]" where [name] is the address, [domain] is the website name, and [tld] represents the Top Level Domain of the website like "com" or "net."

More likely however is that you're attempting to run a test check and you're using your own information or information we have on file with your Green Merchant Account. Our system disallows you from using your own information as most banks would flag a check written from you, to you, as fraudulent causing you all sorts of issues! In order to protect our merchant accounts, we prevent this so if you must test, we suggest you use customer information or a dummy account.

Cannot Create Checks Using Client's Routing and Account

As mentioned in the last section, you cannot use your own information to run checks into your merchant account! If you have to test, use a customer's information or some dummy info!

Client ID Not Found or ApiPassword Supplied Not Correct

There are a few potential reasons for this set of errors:

1. The API credentials used are actually incorrect. Your API credentials are not the same as your Green Portal Login so make sure that you're using the correct things! The Client ID is a 6-7 digit number and your API Password is a 10-15 character alphanumeric string.
2. The API credentials are invalid. Any time a credential reset is requested, any existing API credentials are immediately invalidated so please make sure you are using the latest API credentials sent for each endpoint!
3. The credentials were copied and pasted incorrectly into the configuration. Some devices try to get "smart" when you copy and paste things by copying an additional space character before or after the word you have selected. This works great when you're

pasting it into a text document, but not so great when you need exact values like a password! Make sure you have the exact values correctly copied and pasted with no additional characters.

4. Last but not least, you're attempting to call the wrong API for the endpoint you have specified! The Sandbox API endpoint and the Live API endpoint have separate credentials which are not interchangeable so make sure that if you have your configuration set to Live Mode, you must be using live credentials and vice versa.

Some of my customers aren't able to check out because their routing and account are being denied for being Risky or Bad

This error at checkout is usually associated with a code like "RT00" and a description that lets them know how our verification system returned their information. If your customers are being denied then it is likely for a good reason!

Our verification service has three potential outcomes based on the status of the account. Firstly, it could just pass meaning our verification was successful and nothing bad was found. The second option means the account was found to be Risky. In this case either a bad transaction has been run at least once or potentially no information was known about the account. For risky accounts, our system is indicating that taking that check may be a higher risk than most regular accounts and this is why the default acceptance mode for our WooCommerce plugin is [Legacy mode](#)! The third option is that the service returns the account was Bad and this is typically reserved for accounts which we know cannot process. In most cases this is because the account does not exist, has been previously flagged as fraudulent, or some other circumstance. Bad checks cannot be overridden.

In this case, your customers are receiving this error because either their account was Risky and your settings are on the Legacy mode which disallow them or their account was Bad! If you would like to take Risky payments, please see the [Verification Mode](#) section for information on how to change your mode to Permissive.
